## FOR IMMEDIATE RELEASE

June 12th, 2007

### StackTeck® Adds Capacity

**Brampton, Ontario, Canada-** StackTeck's President and CEO Randy Yakimishyn announced today, that investments are being made in additional equipment to increase capacity and reduce lead times further.

Randy Yakimishyn stated, "Our business volume has increased by more than 50% over the last 5 years. We're very pleased to see that this trend is continuing and, together with our lead time reduction initiatives, we needed some new capital equipment."

New equipment recently installed includes an additional high speed milling machine, which augments StackTeck's existing high speed milling capacity, a key technology for fast, high precision cutting of complex geometries. Another recent addition is a new wire EDM machine that uses heat technology software to significantly increase cutting rates.

StackTeck has also invested in streamlining the communication link between engineering and manufacturing. Multiple stations have been added on the plant floor, to allow viewing and use of CAD 3-D models. Per Yakimishyn, "For key lead time components, we don't need to wait for drawings any longer – once the component model is approved for manufacture, we can start cutting chips."

In support of these capacity additions, plans are being made to bring new injection molding machines into StackTeck's Technical Service Center to expand mold testing and system integration capabilities. According to Yakimishyn, "We are working diligently to advance the forefront of injection molding technology, and it's a key priority to work with the top suppliers of injection molding machines. As customers increase the demand for system integration services, our support capabilities at the Technical Service Center will continue to grow."

### **About StackTeck**

StackTeck, with over three decades of mold building innovation, is a leading source of productivity enhanced tooling solutions for the injection molding industry. StackTeck supplies a wide range of injection molds used to produce plastic parts in applications such as caps, closures, medical, and thin-wall packaging; as well as complete system integrations, In Mold Labeling systems and mold bases. StackTeck has dedicated R&D, testing and part sampling facilities, in addition to plastic part design, prototyping, engineering, and manufacturing capabilities.
